

GSMA Reported Cellular Data Coverage in Africa

These maps show the geographic extent of operator-reported 2G, 3G, and 4G coverage included in each annual GSMA release. Areas classified as having either strong or variable signal are combined into a single mapped coverage category and displayed on a common 1 km grid. Each panel represents the coverage reported for that release, not coverage newly added during that year. Release years generally reflect operator data received through the end of the preceding calendar year.

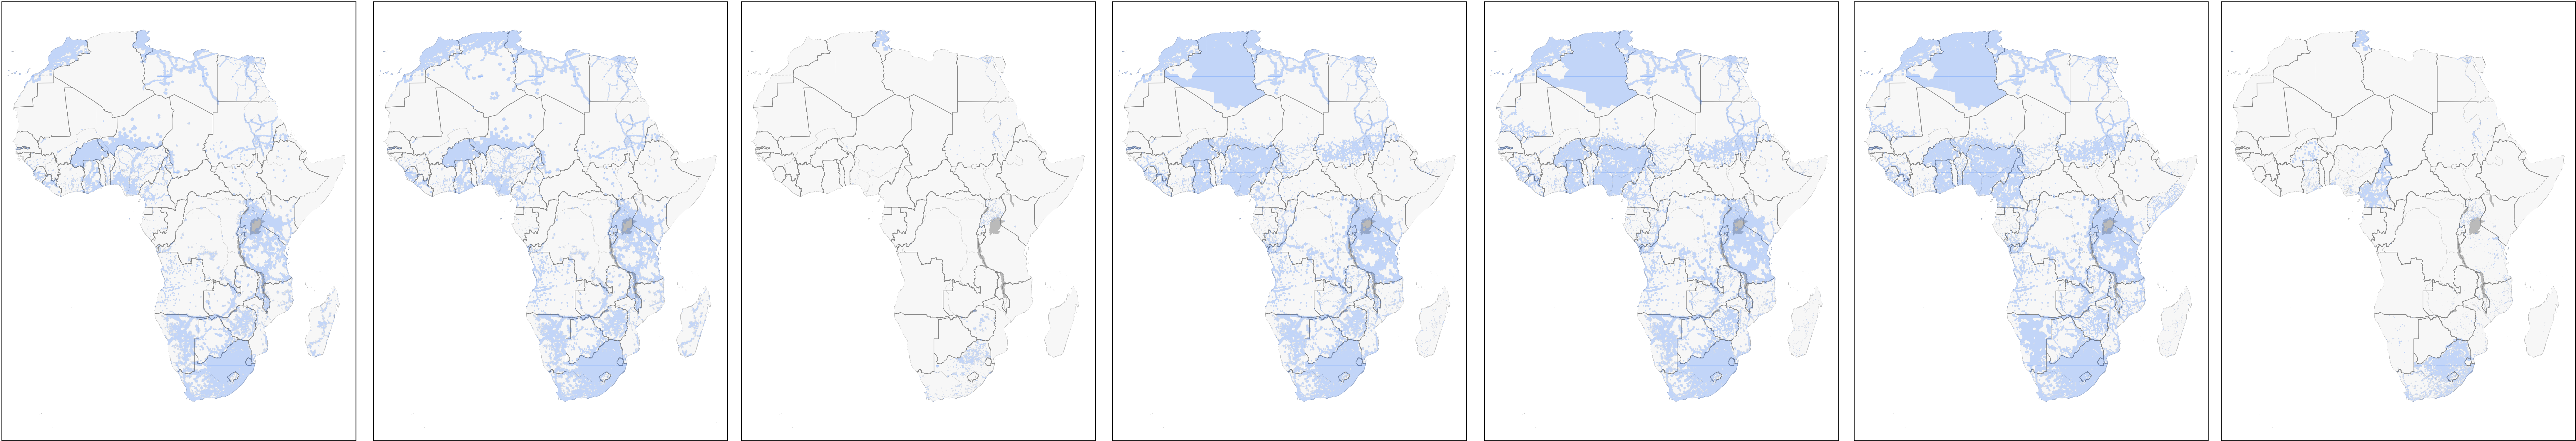

Since not every operator submitted data, gaps and changes between years may reflect differences in reporting as well as changes in network coverage. An area without mapped coverage does not necessarily indicate that service was unavailable.

The figure focuses on the common period from 2012 to 2018. Available 2G and 3G data from 2007 to 2011 were omitted for formatting purposes.

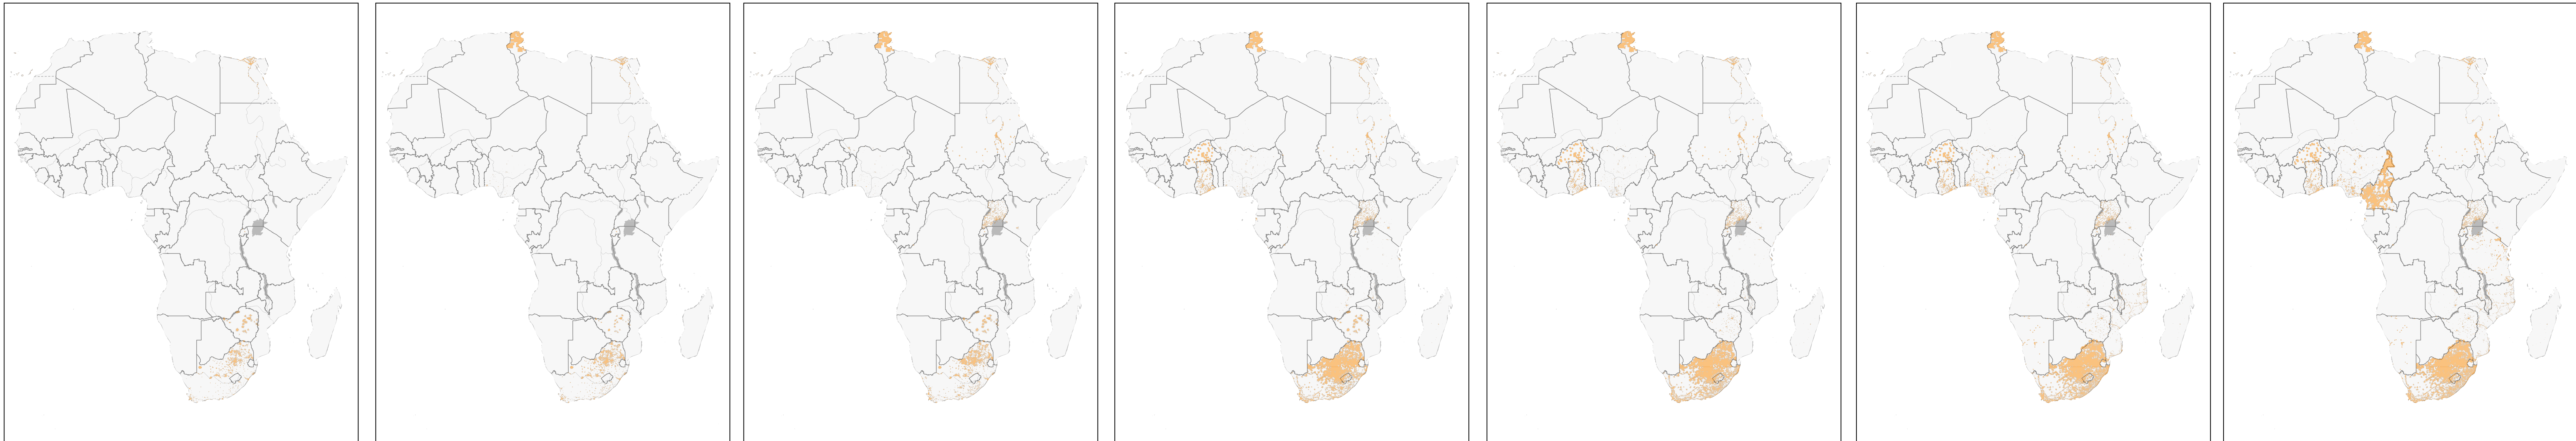

The purpose of the figure is to show the spatial and temporal coverage of the source data, not mobile phone use, subscriber adoption, or independently measured signal quality.
